

## Instructions for connecting / wiring VKO fans by Vents

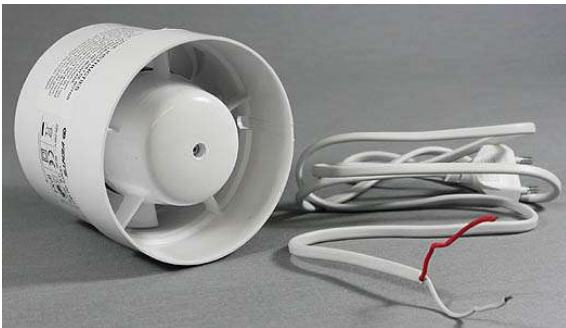

For connecting the tube fan you first of all need the fan, that has to be installed.

To prepare it for the commissioning, you need:

- 1 x Euro line cord with ferrules*
- 1 x slim Phillips-tip screwdriver*
- 1 x slim slot screwdriver*

In order that the fan does something, it obviously has to draw electricity. To accomplish that, you need (apart from your fan) a euro line cord, a Phillips-tip as well as a slot screwdriver.

Take the Phillips-tip screwdriver and loosen the screw that fixes the tube fans protection cover.

Now pull the cable connectors (with ferrules) of the euro line cord through the small hole on the side of the tube fan.

Connect the cable connectors to the **luster terminal**, using the **slot screwdriver** and fix the main cable beneath the  **cable relief** so the danger of accidentally loosening will be diminished (see fig.).
